

Simulation 1 Results Summary

The spreadsheet in this directory provides a general summary of performance of the perceptrons trained on the five different training sets. This is provided in the first worksheet of the spreadsheet. This includes the weights and biases of trained networks (and their relationship to logistic regression coefficients) as well as the output unit activity for the perceptrons for each type of input pattern. The remaining worksheets provide the same data for each perceptron trained on a problem; the worksheets are organized by training set.
