Psychology 452 Week 6: Case Studies In Multilayer Perceptrons

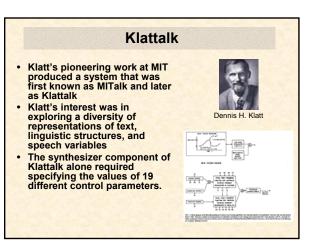

Text-to-speech and neural networks Metric spaces and neural networks Nonmetric spaces and neural networks

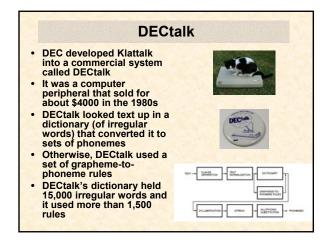

Course Trajectory				
When	What			
Weeks 1-3	Basics of three architectures (DAM, perceptron, MLP)			
Weeks 4-6	Cognitive science of DAMs and perceptrons			
Week 7	Connectionism and Cognitive Psychology			
Weeks 8-10	Interpreting MLPs			
Weeks 11-13	Case studies (interpretations, applications, architectures)			

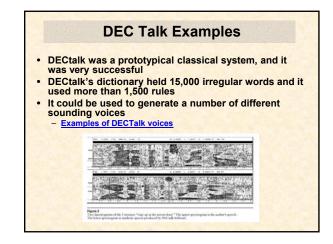

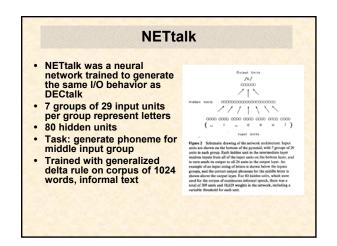

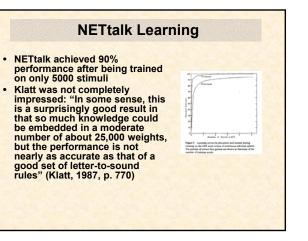

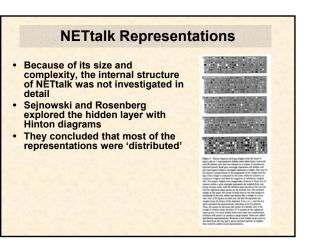

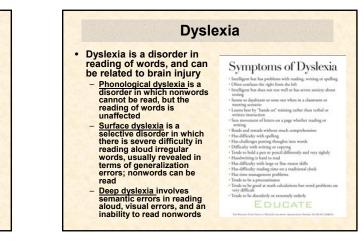

NETtalk Develops

- "During the early stages of learning in NETtalk, the sounds produced by the network are uncannily similar to early speech sounds of children" Examples of NETtalk
 - "The phonological mappings produced by NETtalk are efficient encodings for a parallel network and may be comparable to those used by burgare" Terry Sejnowski humans"
- Descendants of NETtalk have been central in the debate about the kinds of model required to account for reading, as well as symptoms of dyslexia

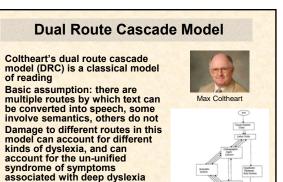

Deep Dyslexia

Deep dyslexia's symptoms are difficult to explain using simple boxologies

- 1. Semantic errors (e.g., BLOWING "wind", VIEW "scene", NIGHT "sleep", GONE "lost");
- Visual errors (e.g., WHILE "white", SCANDAL "sandals", POLITE "politics", BADGE "bandage");
 Function-word substitutions (e.g., WAS "and", ME "my", OFF "from", THEY "the ");
- "the"); 4. Derivational errors (e.g., CLASSIFY "class", FACT "facts", MARRIAGE "married", BUY "bought"); 5. Non-lexical derivation of phonology from print is impossible (e.g., pronouncing nonwords, judging if two nonwords rhyme); 6. Lexical derivation of phonology from print is impaired (e.g., judging if two words rhyme):
- rhyme);
- rhyme);
 7. Words with low imageability/concreteness (e.g., JUSTICE) are harder to read than words with high imageability/concreteness (e.g., TABLE);
 8. Verbs are harder than adjectives which are harder than nouns in reading aloud;
 9. Functions words are more difficult than content words in reading aloud;
 10. Writing is impaired (spontaneous or to dictation);
 11. Auditer unched behave them encours in la maximation.

- Auditory-verbal short-term memory is impaired;
 Whether a word can be read at all depends on its sentence context (e.g., FLY as a noun is easier than FLY as a verb).

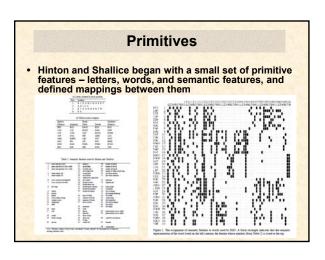

6

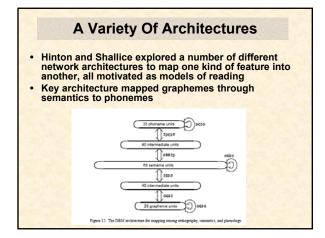

Evolving From NETtalk The success of NETtalk paved the way for other researchers to explore networks that converted text into something else

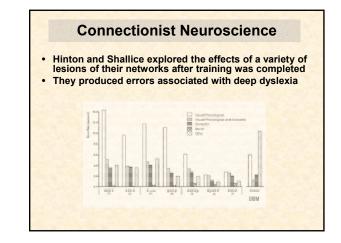

Geoffrey Hinton

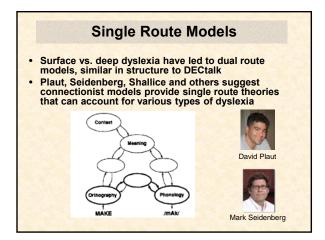

Tim Shallice

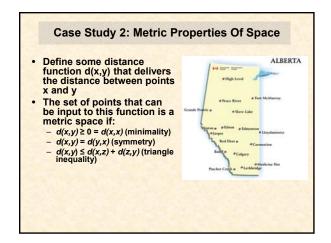

- Geoffrey Hinton and Tim Shallice, for instance, began to study networks that were models of reading
- These networks mapped, for example, graphemes to phonemes but included intermediate semantic representations too
- Issue was whether such models could provide an alternative to classical, multiple route models, like Coltheart's DRC
